

ABSTRACT OF THE DISCLOSURE

1
2 An improved photo identification collection assembly
3 includes a base portion, having a stage, and a support member
4 structured to engage the base portion. A plurality of image
5 collectors, each having a corresponding lens, engage the support
6 member. Each image collector is disposed to focus on an object
7 positioned inside of either a primary stage area, a secondary
8 stage area, or outside of either the primary or secondary stage
9 areas. In addition, the assembly incorporates an image actuator
10 which is structured to generate an actuator signal and
11 communicate the signal to each image collector. Additionally,
12 the actuator signal is designed to cause the plurality of image
13 collectors to simultaneously collect data. Also, the assembly
14 includes a data storage unit which receives and stores the data
15 from the image collectors, and is further structured to permit
16 access and retrieval of the collected data.
